PhD opportunities in Geochemistry

Entry 2027

Geochemistry at Southampton comprises over 30 researchers and postgraduate students who apply state-of-the-art geochemical analysis and modelling to scientific questions of major societal, economic and environmental importance. With over £5M investment in new facilities over the past 5 years, the Geochemistry Group is one of the best equipped centres of its type in the world, allowing us to offer PhD projects that span a wide range of low and high temperature geochemistry research.

Select a project title for details and supervisors.

Beyond 1.5°C: What Can Past Warming Reveal About Climate Thresholds?

Palaeoclimate and climate thresholds

The Life Cycle of Stratovolcanoes: Exploring the Evolution of Magma Dynamics and Eruptive Behaviour

Volcanology and magma dynamics

Quantifying the Impact of Fluid-Rock Reactions on the Magnesium Isotopic Composition of Seawater

Marine isotope geochemistry

The impact of mid-ocean ridge tectonics and sedimentation on hydrothermal exchanges

Ocean crust and hydrothermal systems

Coral calcification in a changing ocean

Coral biomineralisation

Biomineralisation on ice: cryo-analytical insights into ion transport mechanisms

Marine biomineralisation and cryo-analysis

Forecasting volcanic unrest signals before large caldera-forming eruptions

Volcanic hazards and eruption forecasting

Optimising CO_2 Removal through Enhanced Rock Weathering through Multiscale Modelling

Carbon dioxide removal and multiscale modelling

Metals, genomes, and air: decoding how environmental air pollution rewires cellular regulation

Environmental metals and gene regulation

Atomistic simulations of silicate weathering for carbon removal

Mineral weathering and molecular simulation
